

Dyia production incident — resolved

May 14, 2026

What was wrong

The Round 4 deploy on May 3 added a unified subscription gate that reads `subscription_tier` from `dyia_users`. That column was supposed to exist already (migration `032_subscription_tier.sql`) but Supabase never applied it because a second migration file shared the same `032_` prefix, and the runner only records one row per prefix in `schema_migrations`.

The result: every authenticated request to AI-powered routes — insights, assistant, smart quote pricing — failed at the SELECT, was caught by the route's user-lookup error branch, and returned `{ error: "User not found" }`. Marco's mobile screenshot of "Insight unavailable · User not found" was literally that error rendered. The same root cause produced the "Unlock AI Insights" upsell for Pro users on web, because the client-side gate was also returning `isPro=false` for everyone.

What's fixed

- The repair migration (`038_subscription_tier_repair.sql`) is committed to the repo and has been applied to production. The column is present, verified live.
- Marco and Dev are now `subscription_tier='pro'`. They're back to full Pro on next page reload.
- All AI routes succeed against the prod database again.

What's still loose

- **30 paying users are sitting on `tier='basic'` in the database.** The repair migration's column default filled every existing row with `'basic'` before the backfill could write the correct value. Most of those rows are Hanna's QA test accounts that genuinely are on Basic. The ones that aren't — legitimate Pro subscribers from before Round 4 — will see Basic gating until their tier is corrected. The webhook self-heals on the next subscription event (renewal, plan change), so they'll naturally recover within a billing cycle. To fix them sooner, the bulk reconciliation script needs the real Stripe API key, which leads to the next item.

- `STRIPE_SECRET_KEY` in `.env.local` contains a `whsec_...` value (webhook signing secret), not the actual `sk_...` API key. No Stripe API call from local can succeed against that. Worth double-checking the Vercel production env doesn't have the same swap.
- **Migration folder still has two files prefixed `032_`**. Same trap that caused this outage. One of them needs to be renumbered or deleted, plus a one-line CI check (`ls migrations | awk -F_ '{print $1}' | sort | uniq -d`) so this can never recur silently.
- **Brand-new-user forced paywall — product decision.** Hanna's QA matrix lists “Brand-new user lands in app with FREE badge” as expected behavior. The app instead redirects them to the marketing site's pricing section. Round 4 documented this as deliberate but unresolved. Either the redirect comes out (matrix wins, free signups land on the locked-UI experience) or the matrix gets updated (paywall stays, that row removed from Hanna's test plan). Both are one-line changes; just need a call on which one ships.

Cause of the outage in one line

A migration that should have shipped in April was silently skipped by Supabase's runner because of a duplicate filename prefix, and Round 4 deployed code that depended on the column it would have added.
