

# Dyia — platform stability follow-up

May 18, 2026 · deployed to production

## Context

After last week's `subscription_tier` incident note, Hanna and Marco hit four more issues during retest. Three of them were real bugs in our code, one was a synthetic-test-data limitation. Everything below is now live on `dyia.io`.

## What shipped today

| SYMPTOM (WHAT USERS SAW)                                                                                                                                                | FIX                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Brand-new signups were bounced from the app to the marketing pricing section. Hanna couldn't reach row 1 of the QA matrix and new founders never made it past the door. | The forced redirect is gone. New accounts now land in the dashboard on the Free/Basic tier. The trial banner still drives the Pro upsell inline.                                                                                                                                                                                                                                      |
| Marco's Jobs tab kept showing the "Unlock AI insights with Dyia Pro" upsell even though his account is Pro.                                                             | The Jobs tab wasn't being told the user was Pro. Same prop-passing miss that <code>&lt;Quotes&gt;</code> already had fixed in Round 4. Both tabs now agree.                                                                                                                                                                                                                           |
| "Upgrade to Pro" clicks produced a generic error with no useful message. Hard to triage from logs.                                                                      | Every Stripe call now refuses to start when <code>STRIPE_SECRET_KEY</code> isn't a real API key, and returns a one-line, readable diagnostic instead of a blank 500. The user-facing copy is unchanged; the change is that we can see what's wrong the second it happens.                                                                                                             |
| BUG-031 — customer pays via the Stripe link, merchant's dashboard still shows "Payment requested" hours later.                                                          | New reconciliation route ( <code>/api/payments/sync-pending</code> ) asks Stripe directly about anything stuck in <code>pending</code> for the merchant and writes the truth back. The dashboard runs it on load and every time the merchant returns to the tab. The grid now self-heals even if a webhook is delayed, signature-mismatched, or unsubscribed in the Stripe dashboard. |

## What's still on QA / ops to confirm

- **Stripe sandbox subscriptions for Hanna's test accounts.** The retest matrix needs each account in a specific subscription state. The QA accounts are now seeded directly in the database ( `+100` through `+107` , see QA matrix doc). She can validate badges, banners, and gating immediately. End-to-end Stripe flows (real checkout, real invoice history in the billing portal) still require a working sandbox checkout, which loops back to the production Stripe key being valid.
- **Verify the production Stripe env on Vercel.** `STRIPE_SECRET_KEY` must begin with `sk_test_` or `sk_live_` . `STRIPE_WEBHOOK_SECRET` must begin with `whsec_` . If those two are swapped in production (they currently are in `.env.local` ), every Stripe API call fails — including the new sync-pending route — and users see opaque errors on checkout. With today's deploy, those failures now surface with a readable message in Vercel logs the moment they happen.
- **Bulk reconciliation of the ~30 pre-Round-4 Pro users still flagged `tier='basic'` .** Unblocked the moment the production Stripe key above is confirmed correct. Until then, those users continue to self-heal on their next renewal or plan change event from Stripe.
- **Duplicate `032_` migration filename.** Still in the repo. Recommend renumbering one of them and adding the one-line CI check from the previous note before the next migration ships, to prevent another silent-skip outage.

## For Hanna's retest

Once Vercel finishes deploying (typically < 2 minutes from this note):

- Row 1 of the matrix ("brand-new user lands in app with FREE badge") is now reachable. No more forced bounce to `/#pricing` .
- The `+104` Pro account works for Pro-feature validation without needing the Stripe sandbox.
- For BUG-031: pay through the public payment link as before. Within a few seconds of returning to the merchant's tab, the quote/job row should flip to *Paid* regardless of webhook state. If it doesn't, that's now a useful failure — the Vercel function logs will name the specific Stripe API error, which we can act on immediately.
